The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified Leucine rich repeat, capricious related (LRRCAPS) polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent acitvity, where a difference between the test agent-biased activity and the reference activity identifies the test agent as a candidate p53 pathway modulating agent. The method is useful for identifying a candidate p53 pathway-modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in gene therapy. The present sequence is human LRRCAPS DNA
                                                                                                                                                                                                                                                                                                                                                                                          Identifying a candidate p53 pathway-modulating agent for treating cancer comprises contacting an assay system comprising a purified leucine rich repeat, capricious related polypeptide or nucleic acid with a test agent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; p53 pathway; Leucine rich repeat capricious related protein;

Lung cancer cased or decreased or decreased or properties are used for identifying a compound that modulates a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful for treating a modulatory compound identified. The methods are useful contracting a modulatory compound identified. The methods are useful complysems, bronchitis, chronic obstructive pulmonary disease, fibrosis, camphysems, bronchitis, chronic obstructive pulmonary fibrosis, asthma and compounds that modulate lung cancer, such as antibodies. Sequences or dense path as a targets for screening for therapeutic compounds that modulate lung cancer, such as antibodies. Sequences
                                                                                                                                                                                                                                                                                                                                          Detecting a lung cancer-associated transcript in a cell from a patient for treating lung cancer, by contacting a biological sample from the patient with a polynucleotide that exhibits increased or decreased
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; p53 pathway; Leucine rich repeat capricious related protein;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        셤
                                                                                                                                                                                  The invention relates to a method of identifying a candidate p53 pathway modulating agent. The method involves contacting an assay system comprising a purified Leucine rich repeat, capricious related (LRRCAPS) polypeptide or nucleic acid or its fragment with a test agent and detecting a test agent-biased activity, where a difference between the test agent-biased activity and the reference activity identifies the test agent as a candidate p53 pathway-modulating agent. The method is useful for identifying a candidate p53 pathway-modulating agent for preparing a composition for diagnosing or treating cancer. The invention is useful in gene therapy. The present sequence is human LRRCAPS DNA
                                                                                                         Identifying a candidate p53 pathway-modulating agent for treating cancer comprises contacting an assay system comprising a purified leucine rich repeat, capricious related polypeptide or nucleic acid with a test agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; differential expression; cancer; anglogenic disorder; fibrotic disorder; psoriasis; ischaemia; heart disease; atherosclerosis; inflammatory disease; autoimmune disease; retinal neovascularistation syndrome; scarring; uterine fibroid; detection; diagnosis; prognosis, drug screening; drug targeting; wound healing; contraception; cytostatic; cardiant; immunomodulatory; vulnerary; gene therapy; vaccine; gene; ss.

```
The invention relates to nucleic acids and proteins (ADN38683-ADN40064)
whose expression is upregulated or downregulated in specific cancers or
conter diseases such as angiogenic or fibrotic disorders, and to methods
of determining the presence or absence of a pathological cell in a
content by detecting a nucleic acid at least 80% identical to those of
the invention or by detecting a polypeptide of the invention. The
invention also relates to expression vectors and host cells comprising
concleic acid of the invention; antibodies which specifically bind a
colypeptide of the invention; use of such antibodies for druge targeting;
and methods of screening for modulators of activity or expression of the
polypeptides and nucleic acids. The nucleic acids, polypeptides,
cancer and other conditions such as psoriassis, ischaemia, heart disease,
atherosclerosis, inflammatory diseases, autoimmune diseases, retinal
neovascularistation syndromes, scarring and uterine fibroids. They may
also be useful in wound healing and in contraception. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Determining the presence or absence of a pathological cell in a patient, useful for diagnosing, prognosing or treating cancer, comprises detecting a nucleic acid in a biological sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; tumour-associated antigenic target; TAT; cell death; tumour;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human tumour-associated antigenic target (TAT) cDNA sequence #53.

The invention relates to novel polymucleotide and polypeptides for treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polynucleotides of the invention.
                                                                                                                                         Wood WI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Classifying a breast cancer patient according to prognosis comprises determining the similarity between the level of expression of each of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to the isolation of human tumour-associated antigenic target (TAT) polymucleotide and polypeptide sequences. Also disclosed is an antibody that binds to a TAT polypeptide. The antibody is a monoclonal antibody, an antibody fragment, a chimeric antibody or a humanised antibody. It is conjugated to a growth inhibitory agent. It is produced in bacteria or in CHO cells and induces death of a cell to which it binds. The antibody is useful for preparing a composition for diagnosing or treating tumours and cancer. The present sequence represents a human TAT CDNA sequence of the invention.
                                                                                                                                                                                                                                                                                                                                   Smith V;

The invention relates to a method of classifying a breast cancer patient according to prognosis by determining the similarity between the level of expression of each of five genes for which markers are listed in the specification, in a cell sample taken from the breast cancer patient, to control levels of expression for each respective five genes to obtain a patient similarity value. The methods are useful for classifying a breast cancer patient according to prognosis. Kits and computer program products are useful for data analysis using the diagnostic, prognostic and statistical methods of the invention. This sequence corresponds to a marker used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Tumour-associated antigenic target (TAT) cDNA DNA103471, SEQ ID NO:2070.

the interaction features to minimal removal answers and many thus services of the district elated mucleic acids. The TAT polypeptides are overexpressed in cancer tissues compared to normal tissues, and may thus service as effective targets for the disquests and treatment of cancer in mammals. The invention also relates to mucleic acid and polypeptide polypeptide are sequences at least 80% identical to the TAT nucleic acids and polypeptide and polypeptide and antibody specific for a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; dusion proteins comprising a TAT polypeptide; and methods and compositions for the treatment or disquess of cancer in mammals. TAT polypeptides, nucleic acids, antibodies, antagonists. Minding molecules and compositions are useful for disquesing or treating a cell proliferative disorder associated with increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, cancer, cancers of the central nervans system melanoma and leukaemia. TAT nucleic acids may further be used as hybridisation probes, in chromosome and gene mapping, in chromosome identification and in gene therapy. The present sequence represents a TAT nucleic acids may further be represents a TAT nucleic acids in expense.
invention relates to human tumour-associated antigenic target (TAT)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 human; ss; multi-parameter high throughput screening; MPHTS; disease signature; neuropsychiatric; neurodegenerative; schizophrenia; bipolar affective disorder; BAD; autism; Parkinson's; Alzheimer's disease; neuroleptic; nootropic; antimenic; antidepressant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Laeng P;

This invention relates to a novel screening method identified as a multice parameter high throughput screening (MPHTS) assay. Specifically, it refers to an assay that utilises the disease signature of a plurality of specific genes associated with a particular disease, and identifies differential expression between those cells taken from individuals affected by that disease and those that are not affected. The present invention then describes the screening of candidate pharamecutical compounds to identify those that have a potential therapeutic benefit for the treatment of neuropsychiatric and neurodegenerative disorders (BAD) and autism, as well as Parkinson's and Alzheimer's disease. Accordingly, the compounds of this invention exhibit various activities including neuroleptic, nootropic, antimanic and antidepressant. Furthermore, the screening method used in MPHTS will be automated, such that a large number of test compounds may be rapidly screened with a minimal amount of labour and differentially expressed in the presence of a gene that is different than every and and and antidepressed in the presence of a character of the compounds may be rapidly screened with a minimal amount of labour and different than every second and and different and antidepressed in the presence of a character of the compounds may be rapidly screened with a minimal amount of labour and different than the presence of a character of the compounds may be rapidly screened of the presence of a character of the compounds may be rapidly screened of a minimal amount of labour and different than the presence of a character of the compounds may be rapidly and the presence of a character of the compounds may be rapidly and the presence of a character of the compounds may be rapidly and the compounds may be rapidly and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  represents an exemplary efficacy gene for bipolar affective disorder, given in an exemplification of the invention.
                           Identifying a compound that can treat disease or disorders, such as,
                                              neuropsychiatric disorder e.g., schizophrenia, or autism, comprises determining the expression of one or more efficacy genes in a cell contacted with the test compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, chromosome mapping, gene mapping, gene therapy, forensic,

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain caraction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed control useful in gene therapy techniques to restore normal activity of (II) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food polypeptide in tissue, as molecular weight markers and as a food of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The colypeptide and polymorleotide sequences have applications in disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. Abs64197-Abs94564 represent novel human diagnostic coding sequences Abs64197-Abs94564 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in
                               New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 2338 BP; 519 A; 677 C; 608 G; 534 T; 0 U; 0 Other;

The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated bean determined. Sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length colones were obtained by construction of full length enrished cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length human cDNA of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly
                                                                                                         830 Primers useful for synthesizing full length cDNA clones and their use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ota T, Nishikawa T, Isogai T, Hayashi K, Ishii S, Kawai Y; wakamatsu A, Sugiyama T, Nagai K, Kojima S, Otsuki T, Koga H;

This invention relates to a novel primers useful for synthesising full length cDNA molecules that encode human proteins. Specifically, it refers to secretory or membrane proteins that are potential therapeutic agents/ target molecules in the field of medicine, and in particular genes encoding proteins that are associated with signal transduction, glycoproteins and transcription. The present invention describes a method for efficiently cloning a full length human cDNA from both the 5' and 3' ends using the oligo-capping method. This polynucleotide sequence is a full length human cDNA from coth the 5' and 3' entl length human cDNA from coth the 5' and 3' full length human cDNA clone of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to primers for synthesising full length CDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    830 Primers useful for synthesizing full length cDNA clones and their use
              oligonucleotide primers (830 cDNAs) useful for synthesizing full
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ξ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Koga

useful for the producing an antibody, which involves administering the protein or its epitope-bearing fragments to a non-human animal as an antigen. The nucleic acid is useful for diagnosing a disease or susceptibility to a disease related to expression or activity of the protein. A transformant expressing the protein is useful for screening compounds which inhibit or promote STAT6 activation. A transformant expressing the protein is useful for producing a pharmaceutical composition. Compositions, antibodies and antisense molecules are useful composition. Composition, autoimmuse diseases, diabetes, that treating a disease associated with STAT6 activation such as allergic diseases, inflammation, autoimmuse diseases, diabetes, thyperlipidaemia, infections disease and cancers. Compositions are useful for treating disease associated with STAT6 activation and/or prevention for training disease. Compositions are also useful in rheumatoid arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, asthma, allergic rhinitis, ischeemic heart diseases, subarachnoid haemorrhage, viral hepatitis and AIDS. The protein has efficient promoting STAT6 compounds for treating and preventing diseases, subarachnoid haemorrhage, compounds for treating and preventing disease associated with excessive activation or inhibition of STAT6. The present sequence represents a human cDNA encoding a protein which promotes STAT6 activation.

          length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length human cDNA of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly
clarifying the function of the protein encoded by the cDNA. The full

                              This invention relates to a novel primers useful for synthesising full length cDNA molecules that encode human proteins. Specifically, it refers to secretory or membrane proteins that are potential therapeutic agents/ target molecules in the field of medicine, and in particular genes encoding proteins that are associated with signal transduction, encoding proteins that are associated with signal transduction, glycoproteins and transcription. The present invention describes a method for efficiently cloning a full length human cDNA from both the 5' and 3' ends using the oligo-capping method. This polynucleotide sequence is a full length human cDNA clone of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          BB; gene; human; signal transducer and activator of transcription 6; STAT6; immunogen; STAT6 activation; allergy; inflammation; autoimmune disease; diabetes; hyperlipidaemia; infection; cancer; Thi hyperactive disease; rheumatoid arthritis; osteoarthritis; systemic lupus erythematoeus; sepsis; asthma; allergic rhinitis; ischaemic heart disease; subarachnoid haemorrhage; viral hepatitis; AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New signal transducer and activator of transcription 6 activation promoting purified protein, for diagnosing and treating disease associated with activation/inhibition of transcription factor e.g. diabetes and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                   Human cDNA encoding protein that promotes STAT6 activation #63.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Muramatsu S, Ishizawa K;

The invention relates to a purified protein promoting signal transducer and activator of transcription 6 activation (STAT6). The protein is useful for the producing an antibody, which involves administering the protein or its epitope-bearing fragments to a non-human animal as an antigen. The nucleic acid is useful for diagnosing a disease or susceptibility to a disease related to expression or activity of the protein. A transformant expressing the protein is useful for screening compounds which inhibit or promote STAT6 activation. A transformant expressing the protein is useful for producing a pharmaceutical composition. Compositions, antibodies and antisense molecules are useful for the treating a disease associated with STAT6 activation such as a largic diseases, inflammation, autoimmune diseases and cancers. Compositions are useful for prevention diseases and cancers. Compositions are useful contractive diseases and cancers. Compositions are useful for treating diseases compositions disease and cancers. Compositions are useful contractive diseases and cancers. Compositions are useful contractive diseases and cancers. Compositions are useful contractive diseases and cancers. Compositions are useful contractive disease. Also useful in theumatoid arthritis, osteoathritis, systemic lupus erychematosus, sepsis, asthma, allergic rhinitis, and AlDS. The protein has efficient promoting STAT6 compounds for treating and preventing disease associated with excessive compounds for treating and preventing disease associated with excessive compounds contraction of STAT6. The protein begins a general activation or inhibition of STAT6. The protein begins a detivation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        STATE, human; signal transducer and activator of transcription 6; STATE, immunogen; STATE activation; allergy; inflammation; autoimmune disease; diabetes; hyperlipidaemia; infection; cancer; Thl hyperactive disease; rheumatoid arthritis; osteoarthritis; systemic lupus erythematoeus; sepsis; asthma; allergic rhintis; ischaemic heart disease; subarachnoid haemorrhage; viral hepatitis; AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human cDNA encoding protein that promotes STAT6 activation #62.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     activation or inhibition of STAT6. The present sequence represshuman cDNA encoding a protein which promotes STAT6 activation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 2557 BP; 513 A; 729 C; 696 G; 619 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2557

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        viral hepatitis and AIDS. The protein has efficient promoting STATE activity. The protein or nucleic acid is effectively useful for screening compounds for treating and preventing disease associated with excessive
                                                                                                                                                                                                                 The invention relates to a purified protein promoting signal transducer and activator of transcription 6 activation (STAT6). The protein is useful for the producing an antibody, which involves administering the protein or its epitope-bearing fragments to a non-human animal as an antigen. The nucleic acid is useful for diagnosing a disease or susceptibility to a disease related to expression or activity of the protein. A transformant expressing the protein is useful for screening compounds which inhibit or promote STAT6 activation. A transformant expressing the protein is useful for producing a pharmaceutical composition. Compositions, antibodies and antisense molecules are useful for the treating a disease associated with STAT6 activation such as
                                                                                                                                                                                                                                                                                                                                                                                          allergic diseases, inflammation, autoimmune diseases, diabetes, hyperlipidaemia, infections disease and cancers. Compositions are useful for treating disease associated with STAT6 activation and/or prevention of Thi hyperactive diseases. Compositions are also useful in rheumatoid arthritis, osteoarthritis, systemic lupus erythematosus, sepsis, actima, allergic rhinitis, ischaemic heart diseases, subarachnoid haemorrhage,

New isolated Treponema pallidum nucleic acids - used to develop products for the detection, diagnosis, characterisation, prevention and therapy of T. pallidum infections, particularly syphilis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid comprising a sequence encoding an Enterococcus fecalis polypeptide, useful for preparing a composition for diagnosing or treating E. fecalis infection.
                                                                                                                                                                                                                                   AAX20500-21243 represent polynucleotide sequences from the genome of Treponema pallidum. The sequences can be used for detection, diagnosis, characterisation, prevention and therapy for T. pallidum infections, particularly syphilis. They can also be used for detecting diseases related to Borrelia infections in animals, and for the production of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Enterococcus faecalis infection; transcription regulatory element;
                                                                                                                                                                                                                                                                                                                                                                Sequence 19142 BP; 4629 A; 5539 C; 4716 G; 4238 T; 0 U; 20 Other;

                  The invention relates to Enterococcus faecalis polynucleotides and polypeptides. The invention also relates to a recombinant expression vector comprising a polynucleotide operably linked to a transcription regulatory element, a cell comprising a recombinant vector, a method for producing an E. faecalis polypeptide, an isolated nucleic acid comprising comprising the nucleic acid and a cell comprising the recombinant vector. The polynucleotides can be used to detect the presence of E. faecalis in a sample. The sequences are useful for preparing a composition for represents an E. faecalis polynucleotide of the invention. This sequence

The invention useful in developmental biology and in elucidating call signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.

polymucleotide having any of 5544 mucleotide sequences (CDNAs SEQ ID NO: 1-5544) and encoding a polypeptide with any of 5544 amino acid sequences (CSEQ ID NO: 555-1088). The CDNAs and proteins are from corn. soybean, Arabidopsis, wheat and rape but the specification does not indicate which sequences is derived from which organism. Also included is a method of producing a plant having an improved property, comprising transforming a plant with a recombinant DNA construct comprising transforming a plant with a recombinant DNA construct comprising the transforming colypeptide associated with the property, and growing the transformed plant. The property is selected from improving plant cold tolerance, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for improving plant drought tolerance, for providing increased resistance to plant disease, for galactomannan production, for production of plant tolerance to herbicides, for increasing the rate of improving plant tolerance, for improving plant tolerance, for improving plant tolerance to herbicides, for increasing the rate of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New recombinant DNA constructs useful in the field of biochemistry and genetics, and in particular for producing transgenic plants with improved biological characteristics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Plant; ss; gene; transgenic; cold tolerance; growth rate; drought tolerance; disease resistance; galactomannan production; plant growth regulator; heat tolerance; herbicide tolerance; lignin production; extreme osmotic condition tolerance; pathogens resistance; pest resistance; yield improvement; seed oil yield; seed protein yield.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this parent did not form part of printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

chomologous recombination in plants, for lignin production, for improving plant tolerance to extreme osmotic conditions, for improving plant tolerance to extreme osmotic conditions, for improvement by modification of photosynthesis, for modification of photosynthesis, for modification of carbohydrate, nitrogen or phosphorus use and/or uptake anditivity ased protein yield and/or content, for yield improvement by modification of carbohydrate, nitrogen or phosphorus use and/or uptake and for yield improvement by providing improved plant growth and carbohydrate, in the field of blant growth and carbohydrate, and for yield improvement by providing improved and compositions of the present invention are useful in the field of blochemistry and the present invention are useful in the field of blochemistry and carbohydrate, in particular for producing transgenic plants with improved conditions and improving plant colerance to cold or heat, improved nitrogen flow, increasing plant tolerance to cold or heat, improved nitrogen flow, increasing plant tolerance to cold or heat, improved nitrogen colerance to plant pests or pathogens. They can also be used in physical arrays of molecules, plant breeding markers, computer-based storage and arrays of molecules, plant breeding markers, computer-based storage and arrays of molecules, plant from sequence data for this patent did not form part of the printed specification, but was obtained in celectronic format directly from USPNO at a celectronic format directly a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Drosophila melanogaster expressed polynucleotide SEQ ID NO 13124.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Drosophila, developmental biology, cell signalling, insecticide,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 1689 BP; 430 A; 371 C; 326 G; 486 T; 0 U; 76 Other;

This invention relates to chemically pre-treated DNA of genes associated with apoptosis. The nucleic acids are used to allocate patients for specific therapy for HIV infection, Bloom syndrome, cardiopathy, aging, neurodegenerative disorders, Herpes simplex virus infection, renal ischaemia, amyotrophic lateral sclerosis, solid tumours and cancers. This nucleotide sequence represents a chemically treated apoptosis gene. Even SEQ ID numbers are the complementary DNA strands to the odd SEQ ID numbers. The sequence data for this patent is not represented in the printed specification but is based on information supplied by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       syndrome; cardiopathy; neurodegenerative disorder; renal ischaemia; amyotrophic lateral sclerosis;
             including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention
used in the diagnosis and treatment of immune system disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Chemically modified sequences of genes associated with apoptosis are useful to determine methylation patterns of genomic DNA samples for diagnosis of associated diseases such as cancer.
                                                                                                            Sequence 6224 BP; 1471 A; 222 C; 1628 G; 2899 T; 0 U; 4 Other;

AAX12939 to AAX13919 represent these nucleotide sequences which are primary nucleotide sequences, also known as contigs. The computer-based system can identify fragments of the Entercoccus faecalis genome with commercial importance. The products can be used to detect the presence of Entercoccus faecalis in samples. They can also be used for diagnosing Entercocccal infection in an animal and monitoring progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Entercoccus faecalis, in vitro. In particular the polypeptides encoded by the Entercocccus faecalis nucleotide sequences can be used in vaccines to

The invention is useful to diagnose the presence of E.faecalis in a sample or determining the presence of a specific microbe in a sample. The invention is also useful for modulating the growth or pathogenicity of E.faecalis, in a vaccine to confer resistance to Enterococcal infection, for commercial, therapeutic and industrial purposes, and for fermenting a particular sugar source or to produce a particular metabolite. The invention is useful for detecting diseases related to Enterococcus infections in animals, and for detecting E.faecalis using blochip technology. The present nucleic acid sequence represents an Enterococcus faecalis contig DNA sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Computer readable medium having recorded on it a Enterococcus faecalis nucleotide sequence useful for detecting diseases related to Enterococcus infections in animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Computer readable medium; Enterococcus faecalis; microbe; growth; pathogenicity; vaccine; resistance; Enterococcal infection; commercial; therapeutic; industrial; fermenting; mayar source; metabolite; vaccine; biochip technology; antibacterial; modulator of nucleic acid expression;

```
The present invention relates to methods for distinguishing between individuals homozygous for and therefore afflicted with Van Buchem's disease, individuals heterozygous for and therefore carriers of Van Buchem's disease and individuals who are not afflicted with Van Buchem's disease comprise identifying a large genomic deletion in chromosome 17 at 17421. The method is useful for identifying individuals who are afflicted with or carriers of diseases associated with one or more genomic deletion, particularly Van Buchem's disease, which is a rare autosomal creessive disocder that results in a bone dysplasia referred to a cranictubular hypercois. The present sequence is a 92Kb gene fragment in human chromosome 17 at 17421
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; Van Buchem's disease; genomic deletion; craniotubular hypertosis; autosomal recessive disorder; chromosome 17; chromosome 17q21; bone dysplasia; 92Kb gene fragment; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Location/Qualifiers

The present invention relates to novel DNA and protein sequences which are associated with carcinomas. The sequences are useful for: (i) for screening of bloactive agent capable of bloadidates; (ii) for screening of bloadive agent capable of modulating the activity of CAP; (iii) for screening of a bloadive agent capable of modulating the activity of CAP; (iv) for carcinoma; (vi) for inhibiting the activity of CAP; (vii) for diagnosing carcinoma; (vii) for neutralizing the effect of CAP; (vii) for treating carcinoma; (viii) for neutralizing the effect of CAP; (ix) as a blochip; (x) for diagnosing carcinoma or a propensity to carcinoma; and (xi) for determining Carcinoma Associated (CA) gene copy number. In addition, the CA genes are useful as DNA vaccines and the CAP are useful as markers of carcinoma including lymphoma. The present sequence is one such CA coding sequence. Note: This patent is an equivalent to basic patent
                         Recombinant nucleic acid useful for diagnosis and treatment of carcinoma comprises a nucleotide sequence.

The International consortium for macaque cDNA sequencing and
analysis consists of: Department of Virology and Human Genome
Center, Institute of Medical Science, The University of Tokyo,
Tokyo, Japan, Division of Genetic Resources, National Institute of
Infectious Diseases of Japan, Tokyo, Japan, National Health
Research Institute, Taipei, Taiwan, Department of Roology,
Academia Sinica, Taipei, Taiwan, Department of Roology & Evolution,
University of Chicago, Chicago, Liu, USA; Center for Information
Biology, National Institute of Genetics of Japan, Mishima, Japan.

R. Sitel: DraIII (CACTGTGTG)
R. Sitel: DraIII (CACTGTGTG)
R. Sitel: DraIII (CACCATGTG)
R. Sitel: DraIII alter of product was synthesized to caccate the DraIII sites of pMRIBS-FI3. XhoI sites just outside the DraIII sites can be used to isolate the cDNA insert. Libraries were constructed by oligo-capping method. Libraries were made from CACCATG CACCAG CACCATG CACCATG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 APSGSNASTSAPSPLVELIINHIVPPDDKRQNRSFEGWVAAALVAGRALGGLHLIELA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Custom primers were used for 5' and 3'-end sequencing. The full-insert sequencing was done by primer-walking method using ABI DNA sequencer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     764. .. 2026

This sequence of OJ1149 C12 clone has an overlap with OJ1124 D06 (DDBJ: AP004043) clone at 5' end and with OJ1282 B10 (DDBJ: AP005290) at 3' end. The sequence was generated by combining Monsanto and RGP-Japan sequencing data. Detailed information on overlap and assembly quality together with annotation of this entry is available at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /translation="minitssysriamdknykvalrgrranysllivvlpliilloidp

The following abbreviations are used to associate primary accession

numbers given in the feature table with their source databases:

Em: FMBL; Sw:, SWISSPROT; Tr:, TREMBL; Mp:, WORMPRP; Information

on the WORMPEP database can be found at

http://www.aanger.ac.uk/Projects/C elegans/wormpep This sequence

was generated from part of bacterial clone contigs of human

chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping

Group. Further information can be found at

http://www.aanger.ac.uk/HGP/Chr6

RPII-31N4 is from the library RPCI-11.2 constructed by the group

of Pieter de Jong. For further details see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ALS89666 129010 bp DNA linear PRI 18-MAY-2005 Human DNA sequence from clone RP11-32.N4 on chromosome 6 Contains the 3' end of the gene for sorting nexin 14 (SNX14), the 3' end of the NTSE gene for 5'-nucleotidase, ecto (CD73) and a novel gene, complete sequence.
